ENTERPRISE SERVICES

Headquartered in Redmond, Washington, in 2017 Microsoft was an $85 billion technology company that employed 114,000 people and operated around the globe. In 2014, Satya Nadella became CEO and accelerated the company's transformation to a cloud services business model. The transformation inspired new attention to and capabilities around data, particularly in the areas of metrics and dashboards, analytics-powered work processes, and data science services. By 2017, 61 percent of Microsoft's workforce was using business intelligence monthly. This working paper describes Microsoft's journey to becoming a data-driven organization and the key activities that facilitated the company's progress.

## MICROSOFT TURNS TO DATA TO DRIVE BUSINESS SUCCESS

Headquartered in Redmond, Washington, in 2017 Microsoft was an $85 billion technology company that employed 114,000 people and operated around the globe.[1] In 2014, Satya Nadella accepted the role of chief executive officer at Microsoft Corporation and began to accelerate Microsoft's transformation into a cloud services company. Nadella had led the Microsoft Cloud and Enterprise Group from 2011 to 2014, during which time he learned firsthand what a cloud-based business model at the company required: The cloud entailed delivering pre-existing software services in new ways with different pricing structures (such as Office 365,[2] delivered on-demand and priced by usage). The cloud called for generating entirely new revenue streams (such as cybersecurity monitoring) to meet emergent customer needs.

However, business model transformation would not be easy or comfortable for many Microsoft employees. The company had spent much of its history as a leading product-centric company that sold boxed software. This had produced exceptionally well-run siloed businesses such as Xbox and Windows that had little incentive to change.

*Satya had a very hard problem to solve. He had a 90,000-person organization that was based on the concept of independent business units. He had numerous product lines, each being managed as if it had an independent P&L, each with its own engineering team.*

**MICHAEL ALCOCK, DIRECTOR, CIO EXECUTIVE PROGRAMS, CIO CONTENT**

Microsoft's successful transformation into a cloud services company would hinge on its making business processes, company culture, and employee mindset more data driven. More data and better use of it would improve Microsoft's understanding of and responsiveness to customer needs—both critical requirements for effective cloud services delivery. Nadella spoke widely and often, to both internal and external stakeholders, about the company's growing reliance on data.

*The move to the cloud is transformative. The fact that you have the application endpoints now in every device, the usage there is growing every day. But perhaps the most salient point of this cloud transformation is the transformation around data. In other words, it's not just a new way of delivering the software as a service, but it's fundamentally changing the value we deliver.*[3]

**SATYA NADELLA, CHIEF EXECUTIVE OFFICER**

Starting in 2014, Microsoft engaged in three data-oriented efforts to facilitate the transformation of its business model and its organizational culture. First, top management enriched performance management processes with new metrics to better monitor cloud services and identify market needs. Second, business leaders consolidated and reengineered business processes so that employees could work in more efficient, evidence-based ways. Third, the IT department introduced into Microsoft the company's own suite of self-service business analytics tools, Microsoft Power BI, which promoted data and analytics best practices and inspired evidence-based decision making across the organization.

By 2017, the positive impacts from Microsoft's transformational efforts were clear. 61 percent of Microsoft's workforce was using Power BI monthly. Product revenues from Microsoft Azure, the company's public cloud computing platform, had grown by 93 percent. And the company's stock price had nearly doubled (see exhibit 1).

## ENRICHING PERFORMANCE MANAGEMENT WITH NEW METRICS

Microsoft's movement to cloud services required new strategies for monitoring and evaluating business performance. Nadella and his team could no longer rely solely on unit sales figures; they needed a solid understanding of customer engagement and actual product usage to gauge performance and forecast growth.

*If you don't understand how your products or services are being used, then how do you better define your product or service strategy?*

**JACKY WRIGHT, CORPORATE VICE PRESIDENT, CORE SERVICES ENGINEERING**[4]

Nadella wanted to regularly monitor a dozen metrics that served as leading indicators for key pillars of the Microsoft business. For example, Chief Financial Officer Amy Hood had defined and institutionalized a handful of metrics that reflected market power (e.g., the number of active devices using Windows 10, market share measures). But identifying—and then finding—data to support company-wide metrics was challenging.

*Getting data was hard because [it] was buried in source systems or Excel spreadsheets. At times, people don't want to share data between organizations.*

**PATRICK BAUMGARTNER, PRINCIPAL PROGRAM MANAGER, POWER BI**

Some of these new engagement metrics required data drawn from new or previously untapped sources. For example, metrics regarding customers' attitudes about Microsoft services (such as how customers feel about the quality of their Skype calls) were informed by textual data from customer surveys and polls, social media data,

3 Satya Nadella (keynote address, Worldwide Partner Conference 2016, Toronto, Canada, July 11, 2016), https://news.microsoft.com/speeches/satya-nadella-worldwide-partner-conference-2016/#3xsJ7DkiYFHuVSLd.99.

4 In July 2017, Microsoft IT was renamed internally as Core Services Engineering.

and sentiment analyses. Metrics related to product usage (such as whether a customer used a product, for how long, and in what way) originated from telemetry data extracted from the cloud platform.

To help identify data-rich systems and encourage data sharing between businesses, Nadella hosted an internal dashboard-building hackathon. Business units across Microsoft collaborated on building a senior management dashboard; the effort identified both the systems that held critical data and the business owners accountable for results. It also led to the shrinkage of organizational data silos and diminished cross-division resistance to sharing.

*We produced the dashboard as quickly as we could, and then we put columns for every division's data on the scorecard—inserting a N/A or TBD for the groups that didn't contribute data. It didn't take very long before we were getting contacted by the teams with missing data. They wanted to have their data represented on Satya's wall.*

**PATRICK BAUMGARTNER, PRINCIPAL PRODUCT MANAGER, POWER BI**

While Nadella expected the dashboard to evolve over time, to encourage adoption he began using it immediately and regularly. Emulating Nadella's example, leaders across the company created dashboards for their own organizational units.

Certain metrics—particularly ones that reflected customer engagement—resonated and were shared across the company. Business units leveraged these shared metrics in unique ways. Marketing achieved broader and deeper customer engagement by using the metrics to learn how to interact more effectively with customers, such as by messaging customers through products. Product Engineering increased adoption and consumption of services, learning how to improve service quality via the metrics.

Within IT, Chief Information Officer Jim DuBois[5] established a three-person team to develop IT-specific metrics and dashboards. The team excelled at creating leading-edge dashboard content, technology, and processes in short periods of time. Dubois recognized that his executive peers could also benefit from the team's expertise, so he made the dashboard team available free of charge. As a result, Dubois's popular three-person team catalyzed widespread use of dashboards at the senior management level.

## CONSOLIDATING AND REENGINEERING BUSINESS PROCESSES

Nadella appreciated that Microsoft's product-based organizational structure would hamper the company's pursuit of service-related business strategies. Thus, in 2015, he consolidated core business functions (e.g., Sales, Marketing) to encourage open rather than siloed product-oriented perspectives. This structure, Nadella believed, positioned Microsoft to show "one face to the customer."

For IT, this meant that a shared IT services team would continue to provide core enterprise services, while other parts of IT partnered with their respective business functions. Sales, for example, could both leverage shared enterprise capabilities and benefit from a dedicated IT team focused on the sales processes. To encourage cross-functional collaboration, company management adjusted employee incentives so that one of the three core pillars of assessing an employee's performance was based on how well he or she collaborated across the organization.

### Adjusting the Sales Process

Newly consolidated business units across Microsoft began to critically reexamine work practices. Within the sales unit, leaders determined that cloud-based services mandated a completely new, service-oriented sales approach.

*In the old days, I sold you a three-year license. Then a year before that was up, I'd be back on your doorstep saying, "Hey, it's time to renew next year. Let's start talking about how we need to think about that." Now, after I've sold something to a customer, I have to make sure they deploy it and use*

5 Jim DuBois retired as Chief Information Officer of Microsoft in July 2017.

*it on a regular basis. I need to track consumption of cloud-based products. Otherwise, the customer is not going to renew, and Microsoft will lose that revenue stream.*

**CHARLES LASCO, PRINCIPAL PROGRAM MANAGER, CORE SERVICES ENGINEERING**

A service-oriented approach required a comprehensive view—across all products—of customer purchases, support requests, marketing exposure, and miscellaneous other communications with Microsoft. Yet to amass this enterprise view, a sales executive was forced to scan, manually select, and extract data from up to eighty different systems.

To resolve this inefficiency, sales leaders opted to reengineer core sales processes, including pipeline management, opportunity management, and forecasting. Leaders wanted Microsoft's salespeople to spend their time interacting with customers rather than gathering data. Their goal was to increase a salesperson's "effective" time (the time they spent communicating with customers) by 30 percent to 1.5 days per week. The goal was achievable, they believed, if computed insights from the enterprise system replaced inefficient data gathering.

As a first step toward the service-oriented enterprise-wide view, sales leaders attempted to define shared sales concepts—such as what is meant by "pipeline" or "lead"—and build consensus of the agreed-upon definitions among salespeople, sales managers, and IT.

*The definition of what a lead is was a monthlong debate. Eventually we all coalesced around the fact that a lead is a contactable customer. It is a person. A lead is not an idea. That then drove a lot of different decision making in how we think about our platform and … our data model.*

**JAMES DE REUCK, DIRECTOR, SALES PROCESS AND PLATFORMS**

Next, sales leaders looked for data sources that could feed relevant sales-specific metrics into the enterprise platform. The leaders quickly learned, however, that data was scattered across too many discrete sources for its existing platform to provision effectively.

Within a year, the sales and shared services IT teams and their business partners had created an entirely new sales platform called Microsoft Sales Experience (MSX), which culled and consolidated sales data to produce 360-degree views of Microsoft's relationships with corporate customers. For each customer, this new system outlined purchases, detailed issues and complaints, and archived communications.

*Salespeople really need two things. They need fresh data to have conversations with their managers and to have a realistic view of how they are doing against budget commitments or quotas, and they also need help trying to figure out what the next step is or how realistic their forecast is.*

**CHARLES LASCO, PRINCIPAL PROGRAM MANAGER, CORE SERVICES ENGINEERING**

The new system benefited sales managers, executives, and support staff; each of these stakeholders, however, used the system differently. A sales manager, for example, would monitor his or her regional sales pipeline; a sales executive, on the other hand, would view in-depth reports and metrics for his or her individual sales portfolio. To improve the speed and accuracy of sales processes, sales leaders appointed a team to design multiple user interfaces—each customized to a unique sales persona—and to incorporate analytics into the system.

*Forecasts are very poor when they are human based. People are either sandbagging, or they're overly optimistic about the likelihood of closure, and you see $900 million slip from one quarter to the next. When we start applying mathematical models, we can [realistically predict] the likelihood of closure.*

**CHARLES LASCO**

Over time, Microsoft salespeople learned to leverage the new sales system to forecast more accurately.

## WORKING IN NEW WAYS ACROSS MICROSOFT

As sales leaders moved ahead with their business process efforts, other consolidated business units across Microsoft were making similarly dramatic changes to address their own unique needs and pain points.

### Finance

In Finance, leaders targeted improving the effectiveness of financial analysts by reducing the cycle time for moving from financial analysis to field action. Finance leaders believed that they could achieve this by enabling easier data manipulation and analysis and better storytelling skills.

Leaders used a suite of flexible, comprehensive analytical tools to help analysts easily access data and reconfigure their analyses so that they could answer questions on the fly during business reviews. The intention was that analysts should spend more time communicating results to partners—and presenting actionable insights—than producing analyses. To hone communication skills and presentation techniques, leaders established a storytelling training program for analysts with webinars, live demonstrations, videos, and in-person sessions. Within 15 months, these efforts helped financial analysts reduce data gathering time by 30 percent and increased partner communication.

### Human Resources

Human Resources leaders focused on developing the HR team's analytics abilities. HR IT created easy-to-use dashboards using Power BI with help from the shared services IT team. HR managers learned data-driven-decision making skills from HR analysts with whom they were paired by HR leaders.

To educate HR employees on how to use the dashboards and access their benefits, IT created short videos, FAQs, online classes, and instructional manuals. IT used the training data and employee sentiment data from annual employee surveys to measure the success of and satisfaction regarding the training activities.

Via the dashboards, all HR employees could quickly access and track metrics, including employee churn rates and top sources for new hires. Not only did the HR dashboards promote deeper insight into job candidates and employee performance, they also prompted employees to consider how HR activities could be more effective.

### Marketing

Marketing leaders focused less on improving employee skills and more on integrating data with marketing responsibilities. As one Marketing manager explained, the chief marketing officer wanted to "push data as air to marketing teams" to enable real-time customer communications experiments. Marketing's goal was to use data first to reveal a consumer's wants and needs, and then to create a targeted strategy to increase that customer's adoption and consumption of Microsoft's services.

Marketers leveraged Azure Cosmos DB, Microsoft's internal big data solution that sourced data from instrumentalized services, social media interactions, and third-party data sources. They used Cosmos to create demographic, behavioral, and attitudinal profiles of users, and experimented with personalized offers, messages, and services. The results of these experiments were shared across the company via Yammer—Microsoft's own enterprise social networking product—and also in the *Microsoft Journal of Applied Research*, the company's internal journal publication.

## PROMOTING SELF-SERVICE BUSINESS INTELLIGENCE

As Microsoft leaders and employees increasingly relied upon data to make decisions, Jim DuBois invested in and built up four enterprise shared services groups—Data, Data Science, Change Management, and Business Intelligence—to deliver on these needs (see the Microsoft IT Services Offerings organization chart in exhibit 2 for the placement of the enterprise shared services groups). Business Intelligence (BI)—branded BI@Microsoft—was the data service most visible to end users and often employed as a "hook" to promote further data use (see exhibit 3).

*As we're shifting to being a data-driven company, we want to enable everybody to use BI on a self-service basis.*

**KIRKLAND BARRETT, DIRECTOR OF BI@MICROSOFT PROGRAM, CORE SERVICES ENGINEERING**

Jacky Wright, Corporate Vice President, Core Services Engineering, led the four data-oriented groups and encouraged her employees to support and promote self-service business intelligence across Microsoft. Wright and her directors considered the Data, Data Science, and Change Management groups "high-value plumbing" for BI.

The Data group established a "single source of truth" for all data shared across Microsoft (e.g., financial metrics provided to Wall Street, a common list of countries). The group ensured that core[6] data (see exhibit 4) met expected quality standards, and worked to remediate data quality problems. Additionally, the group sponsored and/or worked with data governance committees to resolve issues among business stakeholders, control data access, and identify shared data that should be managed centrally.

Data Science was responsible for "democratizing" analytics and machine learning across Microsoft. The group partnered with both IT and non-IT colleagues to identify unmet needs and created enterprise data services in response. For example, the Data Science group along with security experts within IT developed analytics to improve security and risk management practices. Outside of IT, this group and Facilities colleagues leveraged analytics to create "smart" building heating and cooling solutions.

The Change Management group focused on designing and delivering services to improve the adoption of analytics tools across the organization. For example, the group worked with business process owners to prepare meaningful training materials, and with business units to monitor adoption rates.

BI@Microsoft was focused on supporting the spread of self-service business intelligence to Microsoft's employees and vendors.

*We actually don't build any BI. We are all about helping others go further and faster. We have a preferred supplier network. So if you came to me needing help doing BI, I would share a list of ten suppliers that you can go work with.*

**KIRKLAND BARRETT**

The BI@Microsoft program relied heavily on frequent and scalable communication strategies to promote BI self-service. The program sponsored a website with manuals, videos, and quick-start guides that answered, "What is data, and how can I use data in my world?" The program published monthly newsletters (see exhibit 5), offered online classes, and held virtual office hours. The BI@Microsoft team used Yammer to foster interactive communities. Yammer community members corresponded, answered each other's questions, shared ideas, and inspired innovation.

BI@Microsoft leaders drove Power BI adoption by hiring marketers and training existing IT Services Offerings team members in marketing skills. The use of marketing techniques—including market segmentation, campaign planning, and collecting user surveys—to influence user attitudes and behaviors entailed a skill shift for the IT Services Offerings group.

*By incorporating sales and marketing skills into our process, we have a customer-centric marketing view into how we approach the use of our tools.*

**JACKY WRIGHT, CORPORATE VICE PRESIDENT, CORE SERVICES ENGINEERING**

6 Microsoft categorized data as being either solid core, semi-solid, or fluid. Solid core data was foundational master data managed centrally by IT and shared across the enterprise. Semi-solid data was business process data managed by local business process IT groups. Fluid data represented new types of social, competitive, and market data that were used for experiments and for innovation efforts.

Wright relied heavily on Power BI's engagement metrics to evaluate the success of her directors' activities. Data from many sources was fed into Power BI dashboards.

*We've got [BI] usage data. We've got website traffic data. We've got when we send out emails, what's getting the click-through, and what people are clicking on. We try to correlate that to "Hey, are we seeing uptakes in different groups?" We've got dashboards on pretty much everything we do.*

**KIRKLAND BARRETT, DIRECTOR OF BI@MICROSOFT PROGRAM, CORE SERVICES ENGINEERING**

Wright reviewed engagement metrics with her directors monthly. Each director was expected to identify "usage blockers," a term to describe barriers to adoption, and to create strategies for removing those barriers. This structured approach helped directors prioritize their efforts, measure progress, and nurture wider and deeper Power BI use across the company.

*It's getting up to about 33% of the company doing something in Power BI each month. We are trying to drive weekly active usage up as well. [A leading research analyst firm published] numbers to say 25% is good, 50% is possible. That's what we are trying to hit—getting the monthly active usage up to that 50% level.*

**KIRKLAND BARRETT**

Wright's leadership team relied on business and IT leadership across Microsoft to encourage Power BI use at the local level. Embedded IT groups (e.g., sales IT, finance IT) were critical partners in driving company-wide adoption of data services.

*If we can activate these different business process unit IT groups, then they affect thousands of users. We're constantly looking for amplification points to be able to bubble up the most important things but then also drive out wider usage.*

**KIRKLAND BARRETT**

## BECOMING A DATA-DRIVEN ORGANIZATION

By 2017, employees across Microsoft were incorporating data into their work (see exhibit 6). The changes were striking when compared with earlier Microsoft practices.

*You can't make [a data culture] happen in a few months. It's starting to happen here now after two years. We are starting to see that change happening. It's not about hitting a home run. Every day, you have to get that base hit to affect the larger culture. Then all of a sudden, there is a point at which you realize that everybody is using Power BI.*

**KIRKLAND BARRETT**

Barrett reflected on new habits and behaviors that were the direct result of this new data-centric culture:

*You have the CVP of Manufacturing Management. He comes in and talks about how data is the new currency. That's a win right there. He talks about how he now has real-time dashboards that he brings up on his phone. He cancels meetings because he can [make decisions using] his phone.*

**KIRKLAND BARRETT**

Employee impact on data product development and design was an unintended benefit of Microsoft's growing BI and data culture. Employees' needs and suggestions were collected by both direct and indirect mechanisms. Via crowdsourcing tool UserVoice,[7] employees suggested product improvements and voted on the priority of new features. The BI@Microsoft group monitored Yammer forums for product requirements by analyzing the social streams and identifying common product conversation topics. The shared IT services team disseminated relevant employee feedback to product groups so that it could inform product management, design, and innovation across Microsoft applications.

*It's not just a matter of rolling out something, it's helping the product groups envision where they need to go. So we created very deep partnerships with the product groups. My team meets with them on a daily basis. We meet with their leadership, and we have huge influence on them.*

**KIRKLAND BARRETT, DIRECTOR OF BI@MICROSOFT PROGRAM, CORE SERVICES ENGINEERING**

A second unintended benefit of Microsoft's growing data culture was linked to the number of internal data services that were eventually productized and sold. The shared IT services team required collaboration from Microsoft Product and Consulting Services on these efforts.

*As we [developed internal cybersecurity models by applying machine learning techniques], our data science team partnered with the Security and Risk team and the Product team to create cybersecurity solutions for Microsoft's customers. This has created a repeatable, scalable solution [that] is now being offered to our customers by Microsoft Consulting Services and Field Sales people.*

**SARMILA BASU, DIRECTOR OF DATA SCIENCE, CORE SERVICES ENGINEERING**

Many services, such as the Data Science group's cybersecurity solutions, were productized for Microsoft customers only after rounds of internal use case experimentation and validation. New performance metrics (e.g., revenues generated from productized solutions) were established for groups that offered external services.

Microsoft's success in expanding its cloud platform and services was evident. Use of Microsoft Azure more than doubled during the last quarter of 2016, making it the second most popular cloud platform (after Amazon Web Services, Inc.[8]) and giving Microsoft control of a significant portion of the cloud market. At the 2016 Microsoft Annual Shareholders Meeting, Nadella reported:

*Microsoft Cloud is winning significant customer support. Our commercial cloud annualized revenue run rate exceeds $13 billion, and we remain on track to achieve our goal of $20 billion in fiscal '18. Azure revenue has grown triple digits over the last seven consecutive quarters in constant currency. And more than 60 percent of the Fortune 500 now have at least three of our cloud offerings.*

**SATYA NADELLA, CHIEF EXECUTIVE OFFICER**

Nadella emphasized that business success and culture change go hand-in-hand.

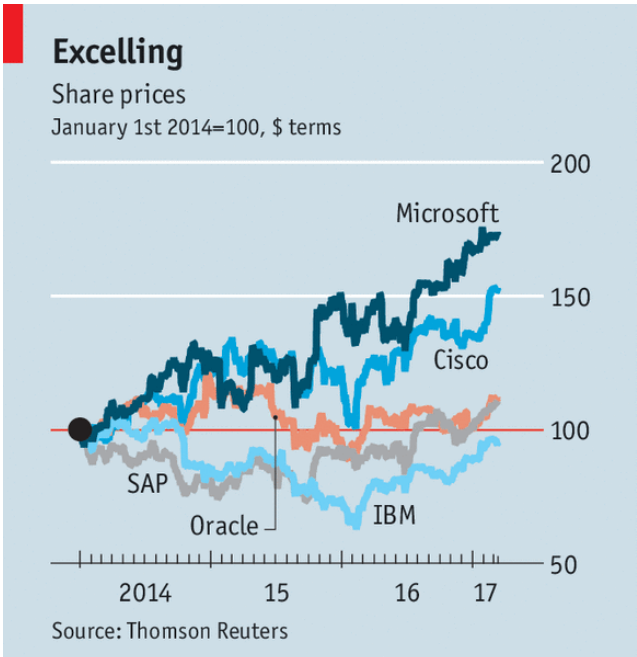

*…It's so important for us to have a sense of purpose and identity and mission, and a culture that allows you to constantly renew yourself, because technologies will come and go. But to me, that sense of identity—about us being able to really contribute to empowering both people and organizations to achieve more—that's at the core.*

## MIT SLOAN CENTER FOR INFORMATION SYSTEMS RESEARCH

**Founded in 1974 and grounded in the MIT tradition of rigorous field-based research, MIT CISR helps executives meet the challenge of leading dynamic, global, and information-intensive organizations. We provide the CIO and other digital leaders with insights on topics such as business complexity, data monetization, and the digital workplace. Through research, teaching, and events, the center stimulates interaction among scholars, students, and practitioners. More than ninety firms sponsor our work and participate in our consortium.**
